Part B: imbalance sweep (solid s=1, dashed s=0.5)
network regret ÷ random play
fraction of agents on the falling side (½ = balanced)
each alone, 1st-order
each alone, 2nd-order
pooled sums (current)
aligned (simple fix)
outer (unbiased)
pooled 2nd-order
Part B: pooled sums degrade with G
sin-angle error of pooled θ
G = mean(μ_i²) / μ̄² (1e3 = perfectly balanced)
pooled sums (current)
aligned (simple fix)
outer (unbiased)
Part B: realistic spread
network regret ÷ random play
network-average slope μ̄ (agents spread over both sides)
each alone, 1st-order
each alone, 2nd-order
pooled sums (current)
aligned (simple fix)
outer (unbiased)
pooled 2nd-order
